ND Filter : Types and Uses

Without ND Filter

With ND Filter

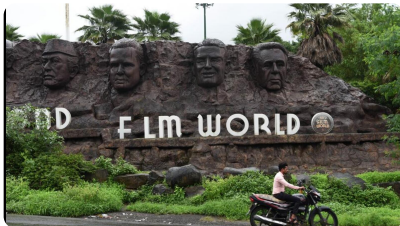

ND filter is basically a single piece combined glass or plastic plates of optical quality, which is screwed before the lens of the camera to achieve uniform darkening of the image. Gray filter / ND filter are also used for movie camera. It is homogeneously colored neutral gray, so the color reproduction is not distorted.

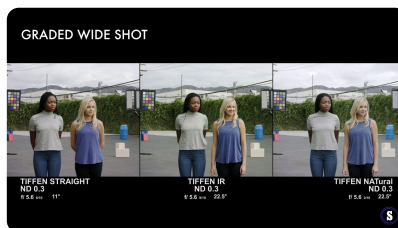

In photography, the reduction of the incident light through the lens at a given film speed, according to the set film speed can be too bright and the lens is not enough to avoid overexposure or desired aperture value or the shutter speed can not be maintained. This can be the case when you want a long exposure or a wipe-out effect.

Photographs are used for educational purpose only. We have no copyright over the individual photographs.
